General

1. The top panel of the boundary detection needs reset when Let's test what you know and Practice Starts is shown. It shows the zpd and the concepts from the previous practice/test session.

2. Increase font size of operands and have the two numbers in different rows, as in the original app.
3. When a problem is solved incorrectly, show the correct answer for a slightly longer period (increase the delay between showing the right answer and the next problem).
4. Remove “Now let’s try something new” from the mastery message.

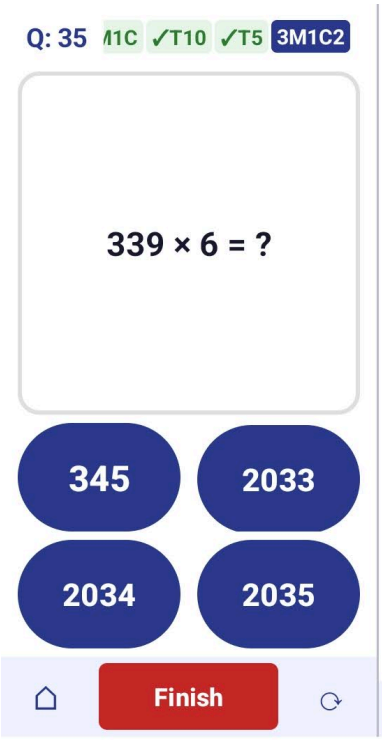

Addition/Subtraction

1. For 1A and 1AC, sometimes the same question appears consecutively one after the other or within the 5 problem window. Need to keep track of it using a queue/stack. Similar check is needed for 1S as well
2. In subtraction, 3S is appearing under Level 2
3. For 3S, 3SB, 3SB2 the second operand need not always be 3 digit numbers. Include one and two digit operands as well. Add a distractor for the misconception of subtracting the second number at the wrong place value. When the second operand is a 3-digit number, make sure that the two operands are not very close.
4. Similarly for 2S2, make sure that the two operands are not very close.

Multiplication

1. Change the multiplication levels as follows:
    a. **Level 1:** T5, T10
    b. **Level 2:** 2M1, 2M1C, 3M1, 3M1C, 3M1C2
    c. **Level 3:** 2M2, 2M2C, 3M2, 3M2C

2. Most of the questions for 2M1, 3M1 are of the type **n x 1**. For T5 and T10 also multiplication involving 1 can be minimized/avoided.
3. 5*6 came for T10
4. Need more intelligent distractors for multiplication of 2 and 3 digit numbers. For many problems, the answer can be found out by simply looking at the last digit.

5. 3M2 problems where the multiplier is a multiple of 10 can be avoided.
6. The knowledge boundary detection is incorrect. We need to change the code.

Division

1. The knowledge boundary detection for is incorrect. We need to change the code.
2. For problems in 3D2 and 3D2R, one of the options looks very odd.

Q: 1 Boundary Test · 3D2

352 ÷ 88 = ?

3 5

4 264

Finish
